- With regard to independent claim 2, Nakayama (JP 11-306628) shows a chucking apparatus in which a plurality of pawl bodies 430 are provided in a radial direction of a hub body 410 (Fig. 16) of a turntable such that the pawl bodies can move, a center hole 9a of a disk is pressed by the pawl bodies to hold the disk, wherein the chucking apparatus comprises a resilient member 440 for biasing the pawl bodies outward of the hub body, each of the pawl bodies includes a pawl portion 433a (Fig. 19) which comes into contact with the disk, and a pawl-side stopper 431a (Fig. 21) for limiting outward movement of the pawl bodies caused by the resilient member, the hub body includes a pawl opening 422 (Fig. 16) through which the pawl portion can project outward, and a hub-side stopper (the vertical wall against 431a) which abuts against the pawl-side stopper, and a coil spring 440 is used as the resilient member, and an outer end of the coil spring is provided at a location lower than an inner end of the coil spring (Figs. 21 and 22); the pawl body includes a rear end surface against which the outer end of the coil spring abuts, the rear end surface includes a first surface against which the upper portion of the coil spring abuts; **but fails to show** a second surface against which a lower portion of the coil spring abuts, and an angel between the first surface and the second surface is changed such that a boundary portion between the first surface and the second surface becomes a convex portion.
- With regard to claim independent 3, Nakayama shows the coil spring is used as the resilient member, the pawl body includes a rear end surface against which the outer end of the coil spring abuts, the rear end surface includes a first surface against which the upper portion of the coil spring abuts; **but fails to show** a second surface against which a lower portion of the coil spring

abuts, and the first surface and the second surface are substantially in parallel to each other and they have steps.

- With regard to independent claims 4, Nakayama shows that the coil spring is used as the resilient member, the pawl body includes a rear end surface against which the outer end of the coil spring abuts, the rear end surface includes a first surface against which the upper portion of the coil spring abuts, **but fails to show** and a second surface against which a lower portion of the coil spring abuts, an axial direction of the coil spring in a state where the coil spring is in abutment against the first surface and an axial direction of the coil spring in a state where the coil spring is in abutment against the second surface are different.
